DEATHS IN CUSTODY SNAPSHOT

1991–2021

There have been **489 Indigenous deaths in custody** since the Royal Commission into Aboriginal Deaths in Custody

2020–2021

Indigenous and non-Indigenous deaths in custody

82

66 deaths in prison custody

12 Indigenous prisoners
54 non-Indigenous prisoners

Indigenous people were less likely than non-Indigenous people to die as a proportion of relevant prisoners, but more likely to die as a proportion of the relevant general population

One in three deaths were self-inflicted*

16 deaths in police custody

3 Indigenous deaths
13 non-Indigenous deaths

15 deaths occurred while police were detaining or attempting to detain the individual

6 of these were police shootings

*21 of the 58 deaths for which manner of death was known

NCIS	National Coronial Information System
NDICP	National Deaths in Custody Program
RCIADIC	Royal Commission into Aboriginal Deaths in Custody

Abstract

The National Deaths in Custody Program has monitored the extent and nature of deaths occurring in prison, police custody and youth detention in Australia since 1980. The Australian Institute of Criminology has coordinated the program since its establishment in 1992, the result of a recommendation made the previous year by the Royal Commission into Aboriginal Deaths in Custody. In 2020–21 there were 82 deaths in custody: 66 in prison custody and 16 in police custody or custody-related operations. This report contains detailed information on these deaths and compares the findings with longer term trends.

Introduction

The National Deaths in Custody Program (NDICP) has monitored the extent and nature of deaths occurring in prison, police custody and youth detention since 1980. The NDICP was established at the Australian Institute of Criminology (AIC) in 1992 in response to recommendation 41 of the Royal Commission into Aboriginal Deaths in Custody (RCIADIC): ‘that statistics and other information on Aboriginal and non-Aboriginal deaths in prison, police custody and juvenile detention centres, and related matters, be monitored nationally on an ongoing basis...within the Australian Institute of Criminology’. The final report of the RCIADIC (1991, recommendation 41) outlined the types of deaths that would require notification to the NDICP. They are:

- a death, wherever occurring, of a person who is in prison custody, police custody or youth detention;
- a death, wherever occurring, of a person whose death is caused or contributed to by traumatic injuries sustained, or by lack of proper care, while in such custody or detention;
- a death, wherever occurring, of a person who dies, or is fatally injured, in the process of police or prison officers attempting to detain that person; or
- a death, wherever occurring, of a person attempting to escape from prison, police custody or youth detention.

This report examines the extent and nature of deaths occurring in prison and police custody and custody-related operations in 2020–21, and compares these findings with long-term trends. In 2020–21 there were 82 deaths in custody: 66 in prison custody and 16 in police custody or custody-related operations. Definitions of these categories are presented in Box 1.

Box 1: Definitions of deaths in custody

Deaths in prison custody

Deaths in prison custody include deaths that occur in prison or youth detention facilities. This also includes the deaths that occur during transfer to or from prison or youth detention centres, or in medical facilities following transfer from adult or youth detention centres (RCIADIC 1991).

Deaths in police custody

Deaths in police custody are divided into two main categories:^a

Category 1

- (a) Deaths in institutional settings (eg police stations or lock-ups, police vehicles, during transfer to or from such an institution, or in hospitals following transfer from an institution).
- (b) Other deaths in police operations where officers were in close contact with the deceased. This would include most raids and shootings by police. However, it would not include most sieges where a perimeter was established around a premises but officers did not have such close contact with the person to be able to significantly influence or control the person's behaviour.

Category 2

Other deaths during custody-related police operations. This would cover situations where officers did not have such close contact with the person to be able to significantly influence or control the person's behaviour. It would include most sieges, as described above, and most cases where officers were attempting to detain a person—for example, a pursuit.

a: This definition of a 'death in police custody' is based on a 1994 resolution of the Australasian Police Ministers' Council. Category 1(a) deaths have been included in the NDICP since 1980, whereas data on police operational deaths (category 1(b) and category 2 deaths) have been collected by the NDICP since 1990

Data used for the NDICP are based on two main sources: data provided by state and territory police services and corrections departments, and coronial records accessed through the National Coronial Information System (NCIS).

As of this report, *Deaths in custody in Australia* is published within six months of the end of the relevant financial year. However, *Prisoners in Australia* data from the Australian Bureau of Statistics (ABS) used to calculate rates in previous *Deaths in custody in Australia* reports had not been released before the preparation of this report. Consequently, rates in this report were calculated using the ABS *Corrective services, Australia, June quarter 2021* data. As such, care should be taken when comparing rates of death over time.

For more information about the NDICP and its methodology, see *Appendix A*.

In the 30 years since the RCIADIC (1991), the NDICP has recorded 489 Indigenous deaths in custody (ie prison custody, police custody and custody-related operations and youth justice; see Table C2).

Deaths in prison custody

2020–21 findings

In 2020–21 there were 66 deaths in prison custody (see Table B1), 23 fewer than in 2019–20 (see Table D1). The death rate also decreased from 0.22 per 100 prisoners in 2019–20 to 0.15 in 2020–21 (see Figure 1). This was the lowest death rate since 2011–12 (0.14 per 100; see Table D5).

The largest number of deaths in prison custody occurred in New South Wales ($n=29$), followed by Western Australia ($n=13$) and Victoria ($n=10$; see Table B1). There were nine deaths in prison custody in Queensland, four in South Australia, one in the Northern Territory and no deaths in Tasmania or the Australian Capital Territory. The death rate was also highest in New South Wales (0.22 per 100), Western Australia (0.19 per 100) and Victoria (0.14 per 100).

Between 2019–20 and 2020–21, there was an increase in the number of deaths in prison custody in Western Australia (+1; see Table D1). The number of deaths decreased in New South Wales (–13), Victoria (–3), Queensland (–2), South Australia (–3) and the Northern Territory (–3). The number of deaths remained the same in Tasmania and the Australian Capital Territory ($n=0$ for each).

Indigenous status

In 2020–21 there were 12 Indigenous deaths in prison custody (see Table B1), accounting for 18 percent of deaths in prison custody over the period. In comparison, Indigenous prisoners made up 30 percent ($n=13,062$) of the average daily Australian prisoner population in the June quarter 2021 (ABS 2021a). In the 30 years since the RCIADIC (1991), the NDICP has recorded 320 Indigenous deaths in prison custody (see Table C2).

The highest number of Indigenous deaths in prison custody in 2020–21 occurred in New South Wales and Western Australia ($n=5$ for each; see Figure 2). There was one death of an Indigenous prisoner in each of Victoria and Queensland. No Indigenous deaths occurred in South Australia, Tasmania, the Northern Territory or the Australian Capital Territory.

There were 54 non-Indigenous deaths in prison custody in 2020–21. The highest number of non-Indigenous deaths were in New South Wales ($n=24$), followed by Victoria ($n=9$), Queensland ($n=8$) and Western Australia ($n=8$).

The death rate of Indigenous prisoners was 0.09 per 100 Indigenous prisoners (see Table B1), or 2.28 per 100,000 Aboriginal and Torres Strait Islander population aged 18 years and over (at 30 June 2020; see Table B2). This was the lowest death rate of Indigenous prisoners recorded since 2011–12 (0.08 per 100; see Table D5). The death rate of Indigenous prisoners was highest in Western Australia (0.19 per 100 prisoners), followed by New South Wales (0.14 per 100) and Victoria (0.13 per 100; see Table B1). In comparison, the death rate of non-Indigenous prisoners was 0.18 per 100 non-Indigenous prisoners (see Table B1), or 0.28 per 100,000 non-Indigenous population aged 18 years and over (at 30 June 2020; see Table B2). It was highest for non-Indigenous prisoners in the Northern Territory (0.38 per 100 prisoners), followed by New South Wales (0.25 per 100) and Western Australia (0.20 per 100; see Table B1).

Between 2019–20 and 2020–21, the number of Indigenous deaths in prison custody decreased by one (from $n=13$ to $n=12$; see Table D2) and the rate of Indigenous deaths in prison custody decreased by 18 percent (from 0.11 to 0.09 per 100; see Table D5). Non-Indigenous deaths in prison custody also decreased over this period in both number (from $n=76$ to $n=54$; see Table D3) and rate (from 0.26 to 0.18 per 100; see Table D5).

The death rate of Indigenous prisoners was lower than the death rate of non-Indigenous prisoners nationally (0.09 and 0.18 per 100 respectively), and in all jurisdictions in which deaths occurred (see Table B1). The death rate of Indigenous prisoners has been lower than the death rate of non-Indigenous prisoners each year since 2003–04 (see Figure 3).

In 1991, the RCIADIC concluded that Indigenous people were no more likely to die in custody than non-Indigenous people, but were significantly more likely to be arrested and imprisoned. The same remains true today. Aboriginal and Torres Strait Islander people comprise three percent of the Australian population (ABS 2019) but, as noted earlier, make up 30 percent of the Australian prisoner population (ABS 2021a).

Sex

Sixty-one male and five female prisoners died in prison custody in 2020–21. This represented a death rate of 0.15 per 100 relevant prisoners for both male and female prisoners (see Table B1). Between 2019–20 and 2020–21, the death rate decreased for male prisoners (from 0.23 to 0.15 per 100) and increased for female prisoners (from 0.10 to 0.15 per 100; see Table D6). The death rate of male prisoners was the lowest recorded since 2011–12 (0.15 per 100).

Of the 61 male prisoner deaths in 2020–21, 11 were of Indigenous prisoners. This represents a death rate of 0.09 per 100 prisoners (see Table B1) or 4.24 per 100,000 relevant population (at 30 June 2020; see Table B2). In comparison, 50 non-Indigenous male prisoners died, representing a death rate of 0.18 per 100 prisoners (see Table B1) or 0.52 per 100,000 relevant population (at 30 June 2020; see Table B2). Of the five female prisoner deaths over this period, one was of an Indigenous prisoner and four were of non-Indigenous prisoners. This represents a death rate of 0.08 and 0.20 per 100 prisoners respectively (see Table B1), or 0.37 and 0.04 per 100,000 relevant population (at 30 June 2020) respectively (see Table B2).

The number of male prisoner deaths in custody has been higher than the number of female prisoner deaths in custody each year since 1979–80 (see Table D4). This reflects the composition of the total Australian prisoner population (ABS 2021a, 2000–20). For every female death in prison custody since 1979–80, there have been approximately 24 male deaths in prison custody. In comparison, for every female imprisoned in Australia in the June quarter 2021, there were approximately 12 males imprisoned (ABS 2021a).

Age

The median age at time of death for prisoners in 2020–21 was 53 years (see Table B1), and was lower for Indigenous prisoners than for non-Indigenous prisoners (44 years vs 56 years). Half of Indigenous deaths in prison custody were of prisoners aged 40–54 years (50%, $n=6$; see Table B1). In comparison, over half of non-Indigenous deaths in prison custody were of prisoners aged 55 years and over (54%, $n=29$). Death rates by age were not calculated for this report due to a lack of available population data (see *Appendix A* for more detail).

Legal status

In 2020–21, 70 percent ($n=46$) of deaths in prison custody were of sentenced prisoners (see Table B1). This represents a seven percent decrease in the proportion of deaths that were of sentenced prisoners in 2019–20 (75%, $n=67$; see Table D11). In comparison, 64 percent ($n=27,793$) of all prisoners in Australia were serving a sentence at 1 June 2021 (ABS 2021a).

In 2020–21, the death rate of sentenced prisoners was higher than that of unsentenced prisoners (0.17 and 0.13 per 100 respectively; see Table B1). This was the seventh year since 1981–82, and the second consecutive year, that the death rate of sentenced prisoners was higher than that of unsentenced prisoners (see Table D12). The death rate of sentenced Indigenous prisoners was higher than it was for unsentenced Indigenous prisoners (0.12 vs 0.04 per 100; see Table B1). This was also true for non-Indigenous prisoners (0.18 vs 0.17 per 100).

The peak death rate of sentenced prisoners, recorded in 1989–90, 1996–97 and 1997–98, was 0.28 per 100. The death rate of unsentenced prisoners reached a peak of 1.16 per 100 in 1983–84 (see Figure 4).

Cause of death

The cause of death was recorded in 59 of the 66 deaths in prison custody in 2020–21. Of these, 61 percent ($n=36$) were due to natural causes (see Table B1). A further 16 deaths (27%) were due to hanging and related complications, the greatest number of hanging deaths recorded since 2002–03 ($n=19$; see Table D13). The remaining seven deaths were due to external trauma (including head injuries and gunshot wounds; 7%, $n=4$), alcohol and/or drugs (3%, $n=2$) or other causes (2%, $n=1$; see Table B1). Most natural cause deaths were of prisoners aged 55 years and over (64%, $n=23$), whereas most hanging deaths were of prisoners aged under 55 years (81%, $n=13$).

The number of natural cause deaths has exceeded the number of hanging deaths since 2001–02 (see Figure 5). However, between 2019–20 and 2020–21 there was an increase in the number (11 vs 16; see Table D13) and rate (0.03 vs 0.04 per 100; see Table D16) of hanging deaths. Conversely, there was a decrease in the number (59 vs 36) and rate (0.14 vs 0.08 per 100) of natural cause deaths over this period.

The cause of death was recorded for 10 of the 12 Indigenous prisoners and 49 of the 54 non-Indigenous prisoners who died in custody in 2020–21. Natural causes were the most common cause of death for both Indigenous (70%, $n=7$) and non-Indigenous prisoners (59%, $n=29$; see Table B1). The natural cause death rate was higher for non-Indigenous than Indigenous prisoners (0.10 and 0.05 per 100 respectively).

Of the 16 hanging deaths, three were of Indigenous prisoners and 13 were of non-Indigenous prisoners. This represented a death rate of 0.02 and 0.04 per 100 relevant prisoners respectively. The rate of Indigenous hanging deaths has remained the same or lower than the rate of non-Indigenous hanging deaths in all but one year over the last decade (see Figure 6). Consistent with previous years, most hanging deaths (81%, $n=13$) involved the use of sheets and the most common hanging point was a cell fitting other than cell bars (38%, $n=6$), such as a cell door. In 2020–21, cell bars were used as a hanging point in one death. The number of hanging deaths in which cell bars were used as the hanging point has decreased since 2004–05, totalling no more than three deaths per year.

Most natural cause deaths were of sentenced prisoners (89%, $n=32$), and the natural cause death rate was higher among sentenced than unsentenced prisoners (0.12 and 0.03 per 100 respectively). Conversely, most hanging deaths were of unsentenced prisoners (69%, $n=11$). The hanging death rate was 0.07 per 100 for unsentenced prisoners, compared with 0.02 per 100 for sentenced prisoners.

Manner of death

The NDICP collects information on both the cause and manner of each death. Cause of death information relates to the direct cause of death, whereas the manner of death refers to the accountability or responsibility for the death (see *Appendix A*).

In 2020–21 the manner of death was recorded for 58 deaths in prison custody. Of these, natural causes were the most common manner of death (62%, $n=36$), exceeding self-inflicted deaths (36%, $n=21$) for the eighteenth year in a row (see Table D18). The number of self-inflicted deaths was the greatest recorded since 2002–03 ($n=21$). One further death in 2020–21 was attributed to unlawful (prisoner-on-prisoner) homicide (see Table B1).

The death rate was highest for natural cause deaths (0.08 per 100), exceeding that of self-inflicted deaths (0.05 per 100; see Table B1). The death rate for natural cause deaths has exceeded that of self-inflicted deaths since 2004–05 (see Figure 7). Consistent with 2019–20, the rate of death attributable to natural causes was higher for non-Indigenous prisoners than for Indigenous prisoners (0.10 vs 0.05 per 100), as was the rate of self-inflicted deaths (0.06 vs 0.02 per 100; see Table B1).

Of the 21 self-inflicted deaths, 16 were due to hanging and related complications, two were due to external trauma, one was due to alcohol and/or drugs and one was due to other or multiple causes (see Table B3). The cause of death was not recorded for one self-inflicted death. The one unlawful homicide was attributed to external trauma.

Most serious offence

The NDICP collects information on the most serious offence (MSO) leading to custody (see *Appendix A* for details of the offence categories). The MSO was recorded for 64 of the 66 prisoners who died in prison custody in 2020–21. Of these, most had been incarcerated for violent offences (81%, $n=52$), followed by good order offences (8%, $n=5$; see Table B1). Violent offences have been the most common MSO recorded for those who died in prison custody each year since 1993–94 (see Table D22). Most Indigenous and non-Indigenous prisoners who died in custody in 2020–21 had been incarcerated for a violent offence (75%, $n=9$ and 80%, $n=43$, respectively; see Table B1).

Location of death

In 2020–21, the most common location at time of death was a cell (50%, $n=33$), followed by a public hospital (32%, $n=21$) and a prison hospital (15%, $n=10$). This was the greatest proportion of deaths to occur in a cell since 2005–06 (50%, $n=14$; see Table D25). Seven Indigenous and 26 non-Indigenous prisoners died in a cell, while four Indigenous and 17 non-Indigenous prisoners died in a public hospital (see Table B1). Since 1979–80, half (50%, $n=996$) of prison deaths have occurred in a cell (see Table D25).

Type of prison

In 2020–21, most deaths in prison custody occurred while the prisoner was in the custody of a government run prison (79%, $n=52$; see Table B1). Fewer deaths occurred while the prisoner was in the custody of a privately run prison (21%, $n=14$). Based on prison population estimates at 30 June 2020 from the Steering Committee for the Review of Government Service Provision (2021), the rate of death was slightly higher in privately run prisons than in government run prisons (0.16 and 0.15 per 100 respectively; see Table B1).

Deaths in police custody and custody-related operations

2020–21 findings

In 2020–21 there were 16 deaths in police custody and custody-related operations (hereafter referred to as police custody) in Australia (see Table B4), eight fewer than the previous year (see Table E1). Typically, the number of deaths in police custody fluctuates annually (see Figure 8), which is attributable to the small number of deaths overall. Death rates in police custody are not calculated due to the lack of data on the national police custody population. Instead, the death rate by Indigenous status and sex described below is calculated as a proportion of the relevant population aged 10 years and over (the age of criminal responsibility).

The largest number of deaths in police custody occurred in New South Wales ($n=8$). There were four deaths in Queensland, three deaths in Victoria and one death in Tasmania. No deaths in police custody were recorded in Western Australia, South Australia, the Northern Territory or the Australian Capital Territory.

Eleven of the 16 deaths in police custody were Category 1 deaths (see Table B4). Category 1 deaths are those occurring during close police contact with the deceased, including deaths in police stations, and most police shootings and raids (see *Introduction*). The remaining five deaths in police custody in 2020–21 were Category 2 deaths, as they occurred during non-close police contact, such as motor vehicle pursuits.

Indigenous status

Of the 16 deaths in police custody in 2020–21, three were of Indigenous people and 13 were of non-Indigenous people (see Table B4). In the 30 years since the RCIADIC (1991), the NDICP has recorded 165 Indigenous deaths in police custody and custody-related operations (see Table C2).

The death rate of Indigenous people in police custody was 0.45 per 100,000 Aboriginal and Torres Strait Islander population aged 10 years and over (at 30 June 2020; see Table B5). The death rate of non-Indigenous people in police custody was 0.06 per 100,000 non-Indigenous population aged 10 years and over (at 30 June 2020).

Consistent with all years of data on deaths in police custody (1989–90 onward), the number of non-Indigenous deaths exceeded the number of Indigenous deaths (see Figure 9). Since 1989–90, Indigenous people have comprised 20 percent ($n=177$) of all deaths in police custody (see Table E5).

Sex

In 2020–21, all deaths in police custody were of males (see Table B4). The number of male deaths in police custody has exceeded the number of female deaths in police custody for all 31 years of deaths in police custody data (see Table E6).

The death rate of Indigenous males was 0.90 per 100,000 relevant population, whereas it was 0.12 per 100,000 relevant population for non-Indigenous males (see Table B5).

Age

The median age at time of death in police custody was 31 years (see Table B4). The median age at time of death was the same for Indigenous and non-Indigenous people (31 years). Deaths in police custody in 2020–21 most commonly involved people aged 25–39 years (75%, $n=12$). Of the four further deaths, three were of individuals under 25 years, and the other was in the 40–54 years age category. For the third year since 1989–90, and the second consecutive year, there were no deaths of individuals aged 55 years or over (see Table E7).

Cause of death

The cause of death was recorded for 10 of the 16 deaths in police custody in 2020–21. Of these, seven were due to gunshot wounds, two to external trauma and one to natural causes (see Table B4). This was the equal lowest number of deaths attributed to external trauma in all years of deaths in police custody data (previously recorded in 2014–15; see Table E10). There were no hanging deaths in police custody for the fourth year in a row.

In 2020–21, one of the three Indigenous deaths in police custody was due to natural causes, and the cause of death was missing for the other two deaths (see Table B4). Seven of the non-Indigenous deaths in police custody were due to gunshot wounds and two were due to external trauma (see Table B4). The cause of death was missing for the remaining four non-Indigenous deaths.

In almost every year since 1989–90, the leading cause of death was either gunshot wounds or external trauma (see Figure 10). Overall, the greatest proportion of Indigenous deaths in police custody have been due to external trauma (33%, $n=57$), followed by natural causes (21%, $n=37$) and head injuries (14%, $n=24$; see Table E11). In comparison, most non-Indigenous deaths in police custody have been attributed to gunshot wounds (37%, $n=262$) or external trauma (30%, $n=211$; see Table E12).

Manner of death

As noted earlier, the NDICP collects information on both the cause and manner of each death (see *Appendix A*).

In 2020–21, manner of death information was available for 10 of the 16 deaths in police custody. Six of these were justifiable homicides (see Table B4), all caused by gunshot wounds from a police shooting (see Table B6). A further three deaths were self-inflicted and one was due to natural causes (see Table B4). Of the self-inflicted deaths, two were due to external trauma and one to gunshot wounds (see Table B6). For the first time in all years of deaths in police custody data, there were no accidental deaths in police custody (see Table E13).

Of the three Indigenous deaths in police custody, one was due to natural causes while the manner of death for the other two was not recorded (see Table B6). Of the 13 non-Indigenous deaths, six were justifiable homicides due to gunshot wounds, two were self-inflicted due to external trauma and one was self-inflicted due to gunshot wounds. The remaining four non-Indigenous deaths had no manner of death recorded.

Since 1989–90, the greatest proportion of Indigenous (48%, $n=79$; see Table E14) and non-Indigenous (35%, $n=244$; see Table E15) deaths in police custody have been accidental. However, the numbers of accidental deaths have been generally decreasing over the last decade (from $n=12$ in 2011–12 to $n=0$ in 2020–21; see Table E13). Deaths resulting from unlawful homicides have remained consistently low since 1989–90, comprising two percent ($n=16$) of all deaths in police custody.

Most serious offence

Data on the most serious offence the deceased was suspected of committing were available for 11 of the 16 deaths in police custody. Seven people were suspected of having committed violent offences, two of good order offences, one of a theft-related offence and one of an offence classified as 'other' (see Table B4). Since 1989–90, deaths of people suspected of committing a violent offence (36%, $n=313$) have been more common than deaths of those suspected of committing any other type of offence (see Table E16).

Two of the Indigenous people who died in police custody in 2020–21 were suspected of having committed violent offences, while the MSO was not recorded for the other (see Table B4). Five of the non-Indigenous deaths in police custody were of people suspected of having committed violent offences, two of good order offences, one of a theft-related offence and one of an offence classed as 'other'. The MSO of the other four non-Indigenous people was not recorded.

Since 1989–90, Indigenous people who have died in police custody have most commonly been suspected of having committed a theft-related (32%, $n=53$), good order (24%, $n=40$) or violent offence (23%, $n=38$; see Table E17). Over the same time period, non-Indigenous people have most commonly been suspected of committing a violent (39%, $n=271$), theft-related (17%, $n=116$) or traffic-related offence (16%, $n=109$; see Table E18).

Location of death

Location of death relates to the location at time of death only. It therefore does not capture the location of any events that caused the death, if this differs from where the individual ultimately died (see *Appendix A*). In 2020–21, the largest proportion of deaths in police custody occurred in a public place (38%, $n=6$), followed by a private property (31%, $n=5$) or a public hospital (31%, $n=5$; see Table B4). Of the five deaths that occurred in a public hospital, four were preceded by incidents occurring on private property and one by an incident in a public place.

The three Indigenous deaths in police custody occurred in a public hospital (see Table B4). The greatest proportion of non-Indigenous deaths in police custody occurred in a public place (46%, $n=6$). A further five non-Indigenous deaths occurred on private property and two occurred in a public hospital.

Since 1989–90, the largest proportion of deaths in police custody have occurred in a public place (40%, $n=358$), followed by a public hospital (28%, $n=250$; see Table E19). Eight percent of deaths over this time period occurred in a cell ($n=75$).

Circumstances of custodial period

In 2020–21, most deaths in police custody occurred while police were detaining or attempting to detain the person (94%, $n=15$; see Table B4). The other death occurred in a circumstance categorised as ‘other’. All three Indigenous deaths occurred while police were detaining or attempting to detain the individual.

Deaths occurring while police were detaining or attempting to detain the individual have outnumbered deaths in any other type of police custody each year since 1992–93 (see Table E20). Since 1989–90, the most common method of detainment has been a motor vehicle pursuit (34%, $n=229$) or other circumstances (eg shooting not elsewhere classified; 37%, $n=249$; see Table E21).

Shooting deaths

In 2020–21 there were seven shooting deaths in police custody (see Table B4), nine fewer than in 2019–20 (see Table E25). Of these, six were police shootings and one was a self-inflicted shooting. Three shootings occurred in New South Wales and two occurred in each of Victoria and Queensland. Since 1989–90, there have been 170 police shootings and 110 self-inflicted shootings in police custody (see Table E25).

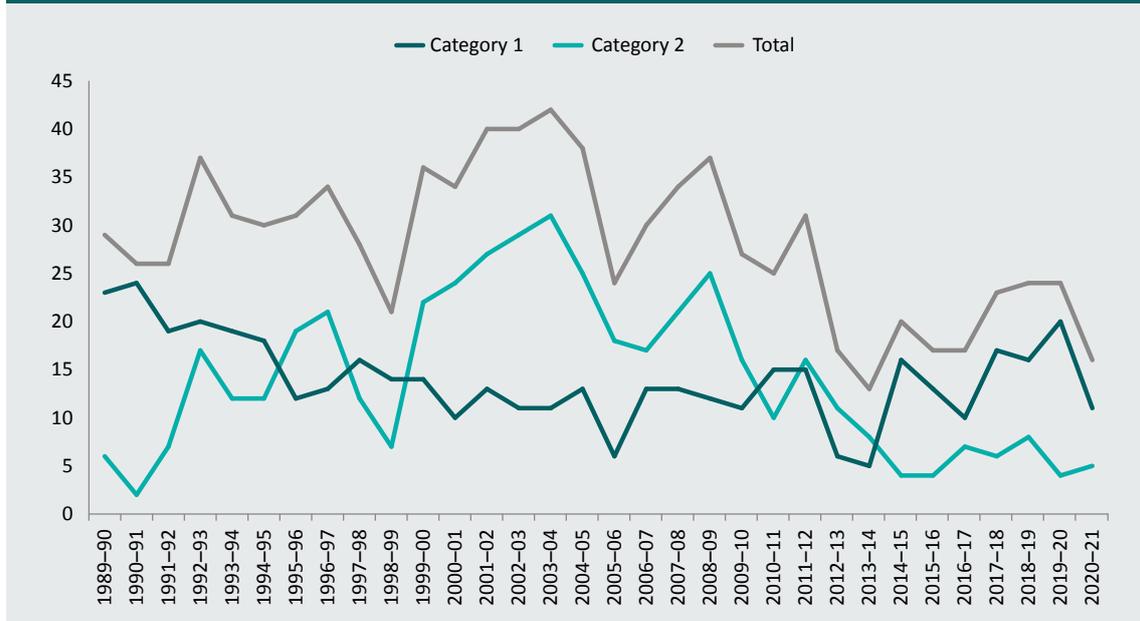

Of the six police shooting deaths in 2020–21:

- All were of non-Indigenous people. The number of police shootings of Indigenous people has been less than or equal to the number of police shootings of non-Indigenous people in all years since 1989–90.
- All were of males. More males than females have died in police shootings in all years since 1989–90.
- Three individuals were suspected of having committed a violent offence and one a theft-related offence. The most serious offence was not recorded for the remaining two deaths. Since 1989–90, just under three-quarters of all police shootings (74%, $n=125$) were of people suspected of having committed a violent offence.
- Three police shootings occurred on private property and three in a public place.

Motor vehicle pursuit deaths

In 2020–21, there were no deaths resulting from a motor vehicle pursuit. This was the third year since NDICP data collection began that there were no motor vehicle pursuit deaths (see Figure 11).

Appendix A: Methodology

Background and purpose of the NDICP

The Royal Commission into Aboriginal Deaths in Custody (RCIADIC) recommended in its final report (RCIADIC 1991) that an ongoing program be established to monitor Indigenous and non-Indigenous deaths in prison, police custody and youth detention.

In response, the National Deaths in Custody Program (NDICP) was established at the Australian Institute of Criminology in 1992 and continues to provide comprehensive and authoritative data on all deaths that occur in custody and in custody-related police operations. The NDICP began recording information in 1992. The program collected data retrospectively for deaths in prison custody and category 1(a) deaths in police custody that occurred between 1980 and 1992. It also collected data retrospectively for police operational deaths (category 1(b) and category 2 deaths) that occurred between 1990 and 1992. This places the NDICP in the unique position of holding detailed information on custodial deaths in Australia spanning 42 years.

The NDICP examines the circumstances of deaths in prison, police custody and youth detention around Australia on an ongoing basis. The purpose of monitoring deaths in custody is to provide accurate and up-to-date information that will contribute to public policy discussion in this important area, and to increase public understanding of the issues. It also allows for the monitoring of long-term trends and patterns in custody and custody-related police operations.

The NDICP is supported by a Steering Group which was established in 2021 to provide advice on matters associated with ongoing program implementation. This includes program design, definitions, data collection, analysis and reporting. The Steering Group helps to ensure that the NDICP is responsive to emerging issues associated with the monitoring of deaths in custody in Australia.

Scope

There are several key differences between the scope of the NDICP and legislated definitions of deaths in custody for coronial purposes. Thus, deaths that may require notification to the coroner under state or territory legislation may not fall within the scope of the NDICP.

The NDICP collects information about the incidence and circumstances of deaths of people who are detained, who are in the process of being detained or who are escaping or have escaped. Therefore, the NDICP only monitors deaths of people who are in custody or who are alleged offenders. The program does not include deaths of people who are clients of police services or innocent bystanders who die in the course of a police operation.

Consequently, deaths in the following circumstances are not recorded as a death in police custody in the NDICP:

- deaths during operations such as search and rescue, and evacuations, where the deceased was not being detained or in the process of being detained for breaching the law;
- deaths during operations to prevent a suicide, where the purpose was not to detain the deceased due to a breach of the law. For example, where police were responding to a concern for welfare notice and were attempting to stop a person suiciding, and the person was not threatening harm to others or not otherwise being sought by police;
- deaths of innocent bystanders killed during a police operation (eg a pedestrian or passenger who dies as a result of a motor vehicle pursuit and who the police were not seeking to detain). If the deceased passenger was involved in committing an offence such as an armed robbery or motor vehicle theft prior to the pursuit commencing, the death falls within the scope of the NDICP.

Data collection and coding

The information held in the NDICP database comes from two main sources:

- NDICP data collection forms completed by all state and territory police services and correctional departments in Australia; and
- coronial records, such as transcripts of proceedings and findings, as well as toxicology and post-mortem reports.

NDICP data collection forms are provided for each death during the financial year. These data are entered and cross-referenced with coronial records sourced from the National Coronial Information System (NCIS). The AIC has access to open cases (those for which the coronial investigation has not been finalised) and closed cases (those for which the coronial investigation has been finalised and the coroner has made a finding) from all jurisdictions.

The AIC confirms the number of deaths and the Indigenous status of deceased people with data providers at the end of each financial year and again prior to preparation of the annual *Deaths in custody in Australia* Statistical Report.

The following describes some of the data items used in this report and the method of coding. The categories used to describe cause of death, manner of death, method of detainment and most serious offence were derived at the inception of the NDICP and have been retained to allow trend analysis. The Indigenous status variable was revised to meet the Indigenous status standard developed by the Australian Bureau of Statistics.

Indigenous status

Indigenous status is classified as Aboriginal, Torres Strait Islander, Aboriginal and Torres Strait Islander, or neither Aboriginal nor Torres Strait Islander. This information, supplied by data providers on the notification form, is cross-referenced with Indigenous status and Indigenous origin fields recorded on the NCIS. Indigenous status is drawn from the police report to the coroner and Indigenous origin, introduced in 2020, from Births, Deaths and Marriages records. Where Indigenous status information from data providers and the NCIS do not correspond, the AIC engages with the data provider to determine evidence of Indigenous status. Where these data cannot be reconciled, Indigenous status is reported as not stated or unknown.

Cause versus manner of death

The NDICP collects information on both the cause and manner of each death. Cause of death information relates to the direct cause of death as reported by the coroner or by police and prison authorities. Cause of death is categorised in the NDICP as:

- natural causes;
- hanging (which includes strangulation) and associated complications;
- head injury;
- gunshot;
- other external trauma/multiple trauma;
- alcohol and/or drugs;
- other/multiple causes; or
- unknown/not determined.

These terms have been used since the establishment of the NDICP and are retained to enable trend analysis.

Manner of death is a related variable, but it refers to the accountability or responsibility for the death as reported by the coroner or by police and prison authorities. It is categorised in the NDICP as:

- natural causes;
- self-inflicted;
- homicide (justifiable, excusable, or unlawful);
- accident (or misadventure); or
- other/not determined.

These categories were derived at the inception of the NDICP based on coronial terminology.

In some cases, cause and manner will correspond; for example, where a person dies as a result of natural causes (eg cancer), both the cause and manner of their death will be recorded as natural causes. In other cases, cause and manner of death will differ; for example, where a person dies after hanging themselves, the cause of death will be recorded as hanging and the manner of death will be recorded as either self-inflicted or accidental.

Most serious offence

The NDICP collects information on the MSO leading to custody. The ABS (2011) Australian and New Zealand Standard Offence Classification is used to group offences into six categories. In order from most to least serious, these are: violent, theft-related, drug-related, traffic, good order and other. Where information on more than one offence is provided, only the most serious of those is assigned to the case. Therefore, if a person has been charged with a violent offence and a theft-related offence, the violent offence will take precedence. For the purposes of the NDICP, these categories are defined as follows:

- violent offence—includes homicide, assault, sex offences, other offences against the person and robbery;
- theft-related offence—includes break and enter, other theft, property damage and fraud;
- drug-related offence—includes possessing, using, dealing, trafficking or manufacturing/growing drugs;
- traffic offence—includes road traffic, driving and licence offences;
- good order offence—includes public drunkenness, protective custody for intoxication (in a jurisdiction where public drunkenness is not an offence), justice procedure offences, breaches of sentencing (including fine default) and other offences against good order (eg betting and gambling, disorderly conduct, vagrancy or offensive behaviour); and
- other—includes offences not elsewhere classified (eg weapons offences).

Location of death

The location information collected by the NDICP relates to the location at time of death. It therefore does not capture the location of any events that caused the death, if this differs from where the individual ultimately died. For example, where a person is shot on private property and later dies in a public hospital as a result of the gunshot wound, the location of death is recorded as public hospital.

Type of custody

Type of custody is based on the deaths requiring notification to the NDICP, as recommended by the RCIADIC (see *Introduction*). They are:

- institutional—deaths that occur in prisons, youth detention facilities, police stations or lock-ups, during transfer to or from such an institution, or in medical facilities following transfer from an institution;
- escaping—deaths that occur during the process of the person escaping or attempting to escape from prison, a youth detention facility or police custody;
- detaining—deaths that occur during the process of police detaining or attempting to detain the person; and
- other—all other deaths not elsewhere classified.

Borderline cases

The NDICP uses the definition of a death in custody recommended by the RCIADIC in determining whether cases should or should not be included in the NDICP database. While most cases are straightforward and clearly fall within the definition, every year there are some cases where it is unclear whether the death should be classified as a death in custody.

For the purposes of the NDICP, a person is considered to be in custody when they are not free to leave the detention or arrest of police or corrections officials. As outlined in the definitions in Box 1 in the *Introduction*, this includes deaths that occur in a hospital if the injury or illness suffered while in custody caused or contributed to that death. In cases where police were clearly in the process of detaining or attempting to detain a person immediately prior to their death, such as during shootings, sieges, raids and pursuits, the person is considered to have been in custody at the time of death. In all cases, the question of inclusion centres on whether the deceased was in custody at the time of death.

Any borderline cases are excluded from analysis pending their coronial outcome. This can mean a delay of several years before data on those particular cases are included, as it may take months or years for a case to be heard in the relevant coroner's court. Despite this, relying on coronial decisions ensures the integrity and reliability of the NDICP over the longer term, as coronial findings are legally binding determinations based on all available evidence. It is important to note that this means the total number of deaths may be revised in future reports as the inclusion or exclusion of borderline cases is resolved.

Data revisions

NDICP data are reviewed annually to ensure the database is accurate and reliable. Where data are missing from the NDICP database, these are checked against coronial findings and other available data, and any necessary revisions made. Consequently, numbers and rates may differ between reports.

In 2021, the AIC began working with data providers in each state and territory to reconcile historical Indigenous status data and ensure that data held in the NDICP were consistent with agency records. At the time of publication, this process has been finalised with:

- corrections departments in Victoria, Queensland, Western Australia, South Australia, Tasmania, the Northern Territory and the Australian Capital Territory; and
- Western Australia Police Force.

The process is ongoing with Corrective Services New South Wales, and police agencies in New South Wales, Victoria, Queensland, South Australia, Tasmania, the Northern Territory and the Australian Capital Territory. Data revisions will be made where required in the *Deaths in custody in Australia 2021–22* report, to be released by the end of 2022.

Additionally, an audit was undertaken of the location of death variables. As such, numbers relating to the location of death published in this report differ from those in previous reports.

Calculation of death rates and population rates

Before 2021, death rates were calculated using the ABS *Prisoners in Australia* data (ABS 2000–20), which counts all prisoners in legal custody in each jurisdiction as at midnight on 30 June each year. As of 2020–21, *Deaths in custody in Australia* reports are published within six months of the end of the financial year. This change in the timing of the publication means the ABS *Prisoners in Australia* data could not be used to calculate rates as these data were not publicly available during the preparation of this report. As such, rates of death in prison custody by prison population have been calculated using the ABS *Corrective services, Australia, June quarter 2021* data (ABS 2021a). These data are provided to the ABS from administrative records held by corrective services agencies in each state and territory and refer to the average daily prisoner population throughout the month of June, or the prisoner population on 1 June. These data include a breakdown by legal status, custody type, Indigenous status and sex but not age. As such, death rates for each age group could not be calculated for this report. For these reasons, care should be taken when comparing rates of death over time.

Where trends in rates of death are presented, the rates are calculated back to 1982, as prison census data were not available until 1982. The prison population is the standard denominator for calculating death rates in prison custody, reflecting changes in prison demographic composition.

Rates of death in police custody are not presented in this report because there is no reliable data source for the number of people placed into police custody each year or who come into contact with police in custody-related operations.

Population rates are presented for deaths in prison and police custody. Population rates are calculated using June 2020 population data from the ABS *National, state and territory population* (ABS 2021b) and the 2006–2031 Aboriginal and Torres Strait Islander population projections (ABS 2019). Rates of death in prison custody are calculated using the population aged 18 years and over, as no deaths occurred in youth justice in 2020–21. Rates of death in police custody and custody-related operations are calculated based on the population aged 10 years and over (the legal age of criminal responsibility).

Limitations

Time frames

The release of NDICP reports relies on the availability of the two primary sources of data. Data for this report were prepared for publication in the three months after the conclusion of the financial year. This time period means that data for most cases available on the NCIS were limited by the number or comprehensiveness of coronial records. As such, details may change once coronial investigations are finalised.

Contextual information

The purpose of the NDICP is to monitor annual and trend information on the nature and extent of deaths in Australian prison and police custody. This function is performed through the collation and cross-referencing of quantitative data from police services, correctional departments and the NCIS on the characteristics of the deceased and the circumstances of the death. Compiling qualitative data from coronial findings sits outside the scope of the NDICP and these data are not routinely reported in the *Deaths in custody in Australia* series. These contextual data are instead collated for individual studies examining specific population groups or categories of deaths.
